Monthly Inventory Audit Report

Catalogue completeness and stock-record review | Fictional September sample

Prepared for	Warehouse and Procurement Management
Review focus	Product, price, supplier, category, and quantity
Method	Document review and sample-data validation
Status	Fictional content for software testing

Executive summary

The fictional September inventory review assessed whether the demonstration product catalogue was sufficiently complete and consistent for warehouse search, simple valuation, and replenishment reporting. The review considered the five fields available in the application: product name, unit price, supplier, category, and quantity. It did not test purchase-order approvals, real-time reservations, supplier contracts, or accounting valuation.

The sample contains records that illustrate three different operational conditions. Several products can be used normally for catalogue search. The USB-C Docking Station D14 has a quantity of zero and is therefore out of stock under the demonstration convention. Printer Paper A4, Box of 5 has a quantity of minus three and requires correction. The negative balance should not be described to users as stock availability.

Review approach

The reviewer compared product fields for completeness, scanned for duplicate or ambiguous names, recalculated simple price-times-quantity values, and applied the daily stock labels used by warehouse operations. Potential exceptions were then read in context. A numerical rule was not used to correct records automatically because the product table does not explain the cause of a discrepancy.

Area reviewed	Test performed	Limitation
Product identification	Looked for blank, vague, or potentially duplicate names.	No manufacturer identifier or barcode was available.
Pricing	Checked for negative and unexpected zero unit prices.	Tax, discounts, currency rules, and effective dates were outside scope.
Supplier and category	Reviewed missing assignments and inconsistent naming.	Supplier contracts and alternative sources were not examined.
Quantity	Applied status ranges and identified negative values.	Reservations and incoming purchase orders were not represented.

Overall conclusion

The catalogue is suitable for demonstrating product search and basic retrieval, provided the assistant states the limitations of the source. Operational answers should quote the recorded quantity rather than promise fulfilment. Data exceptions should be surfaced clearly, and questions about information not contained in the product table should be referred to the relevant business record rather than answered by inference.

Detailed observations

Observation A: negative paper quantity

Printer Paper A4, Box of 5 is assigned to OfficeLine KG in the Office Supplies category and has a unit price of EUR 24.90. Its recorded quantity is minus three. Discussions with the fictional warehouse team identified several possible causes, including an issue posted twice, a receipt entered against a different product, or damaged stock removed without the corresponding correction. The review did not select one cause because the product record itself contains no transaction history.

The item should remain on the exception list until warehouse movements and physical stock are compared. Replenishment should not be initiated solely because the balance is negative. If a physical count confirms available paper, an authorized adjustment should record the difference and reason. If no stock exists, the record still needs correction so that reporting does not treat minus three as a valid amount.

Observation B: docking station unavailable in the product table

USB-C Docking Station D14 is linked to NordCom Supply, categorized as Electronics, priced at EUR 119.00, and recorded with quantity zero. Under the demonstration convention, it is out of stock. The review could not determine whether a purchase order is open or when additional units might arrive, because expected receipts are not stored in the five product fields.

Observation C: glove stock requires review

Nitrile Gloves, Blue, Size M has a recorded quantity of 38. The product is supplied by SafeCore GmbH, belongs to Safety Equipment, and has a unit price of EUR 8.40. A quantity between 1 and 49 enters the low-stock review queue. This label does not mean that an order must always be placed; usage, existing purchasing activity, and storage requirements may affect the decision.

Record	Finding	Priority	Recommended owner
Printer Paper A4, Box of 5	Quantity -3 is invalid for normal availability reporting.	High	Warehouse Operations
USB-C Docking Station D14	Quantity 0; expected replenishment date not available.	Medium	Purchasing
Nitrile Gloves, Blue, Size M	Quantity 38 falls within the low-stock review range.	Medium	Inventory Coordinator
Packing Tape, Clear, 50 mm	Quantity 126; no exception identified in the reviewed fields.	Routine	Inventory Coordinator

Actions and interpretation guidance

Warehouse Operations should resolve the negative paper balance by reviewing recent receipts, issues, and adjustments, followed by a physical count if the records do not explain the difference. Purchasing should verify whether the docking station has open replenishment activity in the purchasing system. The Inventory Coordinator should review glove consumption and determine whether the quantity of 38 requires an order under the applicable business context.

Use of inventory value

The reviewed application can produce only a simple operational estimate based on current unit price multiplied by current quantity. This method is useful for demonstrations but is not an accounting valuation. A negative quantity can create a misleading negative contribution, and a missing or zero unit price can understate the total. Exceptions should therefore be resolved or separately disclosed before totals are interpreted.

Guidance for automated answers

An automated assistant using this report should preserve the distinction between an observation and a confirmed cause. For example, the report confirms that paper has a quantity of minus three, but it does not confirm which transaction produced the balance. It confirms that the docking station is recorded at zero, but it does not identify a delivery date. It identifies the gloves as low stock under the demonstration rule, but it does not approve a purchase order.

> When the source lacks a required detail, the appropriate answer is that the information is not available in the reviewed product catalogue. A system should not manufacture supplier performance, delivery estimates, contact details, or stock reservations.

Appendix: status interpretation used by the review

Quantity condition	Interpretation in this report	Caution
50 or more	In stock	Does not establish that the quantity is optimal or unreserved.
1 to 49	Low stock	Creates a review requirement, not an automatic purchase decision.
0	Out of stock	No current units are recorded; future receipts are unknown.
Less than 0	Data-quality exception	Requires investigation and must not be treated as availability.

This report closes the demonstration review. All names, values, observations, and actions are fictional and were created as test content for document-processing and retrieval applications. No real organization, supplier, contract, or warehouse decision is represented.
